

# INTEGRATIONS

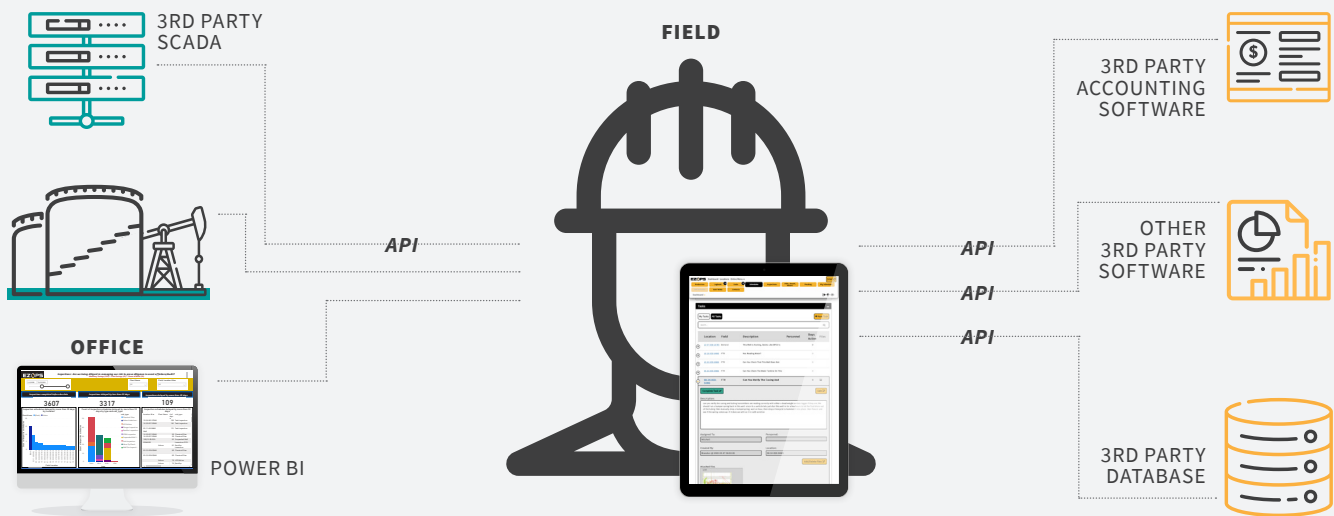

## Support data-driven decisions with integration

EZ Ops architecture is specifically designed to connect to third-party applications to support the best informed, data-driven decisions possible for optimal operations.

Our system is engineered to support real-time data visibility by tying into multiple systems with the customer retaining data ownership, and with certainty of data security.

### FIELD MANAGEMENT SOFTWARE FOR EFFICIENT OPERATORS

## VALUABLE CONNECTIONS

Integrations are possible with emissions compliance, asset integrity, production accounting, pipeline operations and mapping systems to name a few. Our approach to integration is based on our customer's needs and seeking to continually improve the functionality we offer to all the producers we serve.

## HOW WE CONNECT

For most integrations, connecting through our API is most effective. Depending on your needs we can also utilize existing data passing infrastructure like FTP.

In every case, our team of data experts consult with your IT team to understand your needs, current application and data infrastructure. We then help diagnose the best method of application connection and guide the process to completion on time and within budget.

## How can we help you?

Assess how our software can support your efficient operations.
